Release Notes

BUG FIX (13906) – It was found that the system was allowing duplicate plant external ID's within the same .csv. The system has been updated to compare the file for duplicates and provide an error if a duplicate is found.

BUG FIX (13912) – It was found that the system was allowing blank values instead of treating them as nulls. The system will now reject a blank value and send an error.

BUG FIX (13915) – When an unknown processing error message was sent, the system was sending the error message multiple times. The system has now been updated to eliminate the redundant/duplicate emails.

BUG FIX (13920) – When uploading an inventory file with a product name referenced longer than 50 characters, the system was not processing the file and was sending an unknown processing error message stating something is wrong with the file. The expected result is that the system should accept 75 characters for product name.
