### **Release Notes**

BUG FIX (13113) – Issue was found that if an update operation was performed before an insert operation, the system would not send an error message and the record was not inserted. This was fixed and deployed to the test environment. The system is now validating update/delete operations and will send notification on the lab license number as expected.

BUG FIX (13152) – Issue was found that if an error occurred with one csv file while uploading multiple files, the system would stop processing the files after the error. This was fixed and deployed to the test environment. The system will now continue to process the rest of the package even if there is an error with one of the csv files.

BUG FIX (13172) – Whenever a poorly submitted csv file was uploaded, the system was not processing the files but also was not sending notification to the integrator or licensee that uploaded the file. This was fixed and deployed to the test environment. The system will now send a generic email to the uploader letting them know that there are errors that need to be fixed.

BUG FIX (13192) – Issue was found that if a file received is larger than 10MB and there are errors in that file, the system would lock up and would attempt to send the error file over and over again which resulted in other files unable to process. This was fixed and deployed to the test environment. The system is now deleting the parent file of the large upload after the initial notification is sent out so the system can continue to process.

BUG FIX (13197) – Issue was found that the plant transfer validation was looking at the from licensee rather than the to licensee. This was causing an error to be thrown. This was fixed and deployed to the test environment. The system is now validating against the to licensee as expected.

BUG FIX (13198) – Issue was found that the plant transfer validation was looking at the from and to plant external identifiers rather than the from and to plant transfer external identifiers. This was fixed and deployed to the test environment.

The system is now validating against the to and from plant transfer external identifiers as expected.

BUG FIX (13199) – Issue was found that the Inventory Transfer was validating against the from licensee instead of the to licensee when submitted by an integrator. This was fixed and deployed to the test environment. The system is now validating against the to licensee when csv file is uploaded by integrator as expected.

BUG FIX (13202) – Issue was reported that secondary integrators lost their ability to view the associated licenses. A check was added to match logged in emails with integrator ID. This was fixed and deployed to the test environment. Secondary users for integrators are able to view associated licenses now as expected.

BUG FIX (13206) – Issue was found that inventory quantity was not accounting for decimals. This was fixed and deployed to the test environment. The system is now handling decimal errors when integers are expected.

BUG FIX (13214) – Update to lookup values for InventoryAdjustment, LabTest, Sale, Destruction, Plant csv files.
